

# Developing Goals and Strategies to Improve Water Quality

Matt Diebel

Wisconsin Department of Natural Resources  
Bureau of Science Services

# Outline

- How to use state water quality standards to set goals for streams and lakes
- How to identify/deal with factors that may prevent or delay the achievement of water quality goals
- How to prioritize watershed projects

# Wisconsin Surface Water Quality Standards

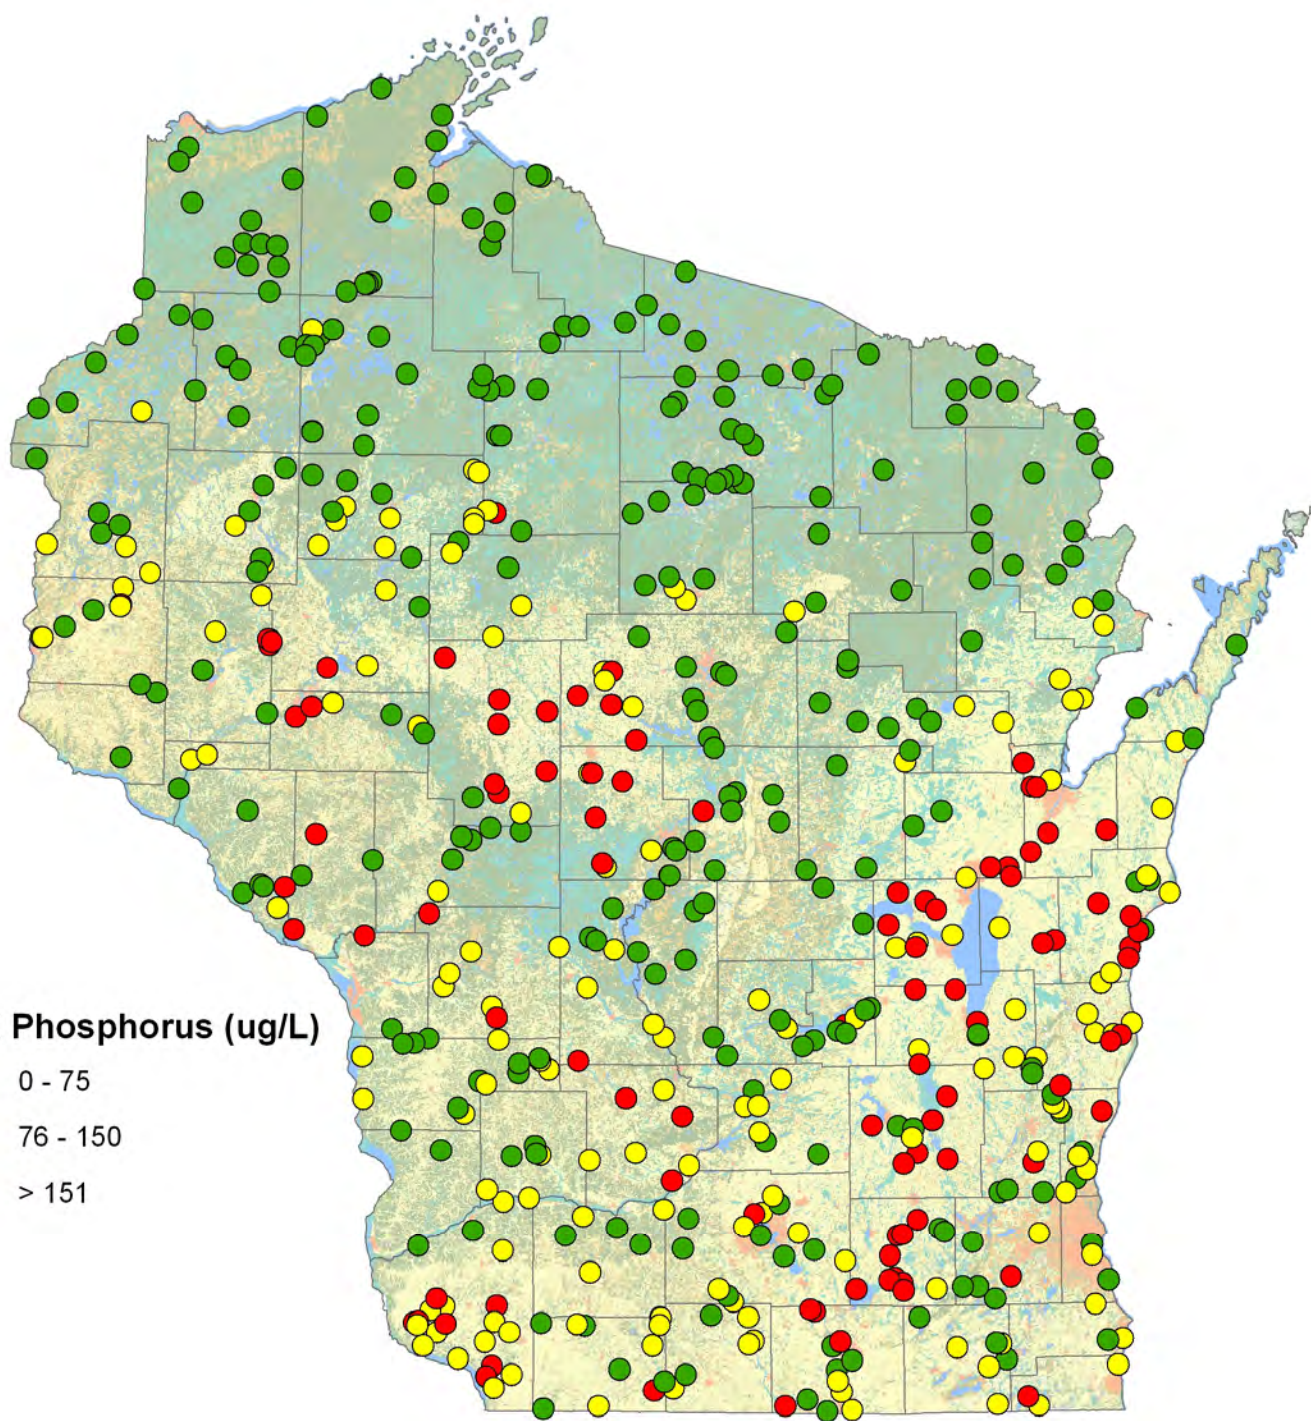

## Phosphorus (NR102)

- Streams and Rivers (Median of 6 samples from May – Oct.)
  - 100 µg/L for rivers named in statute
  - 75 µg/L for all other streams and rivers
  - Median of 6 monthly samples (May-Oct)
- Lakes (Average of 6 samples from June 1 – Sept. 15)
  - 40 µg/L for shallow lakes
  - 30 µg/L for deep drainage lakes
  - 20 µg/L for deep drainage lakes
  - 15 µg/L for two-story fishery lakes

**Total Phosphorus (ug/L)**

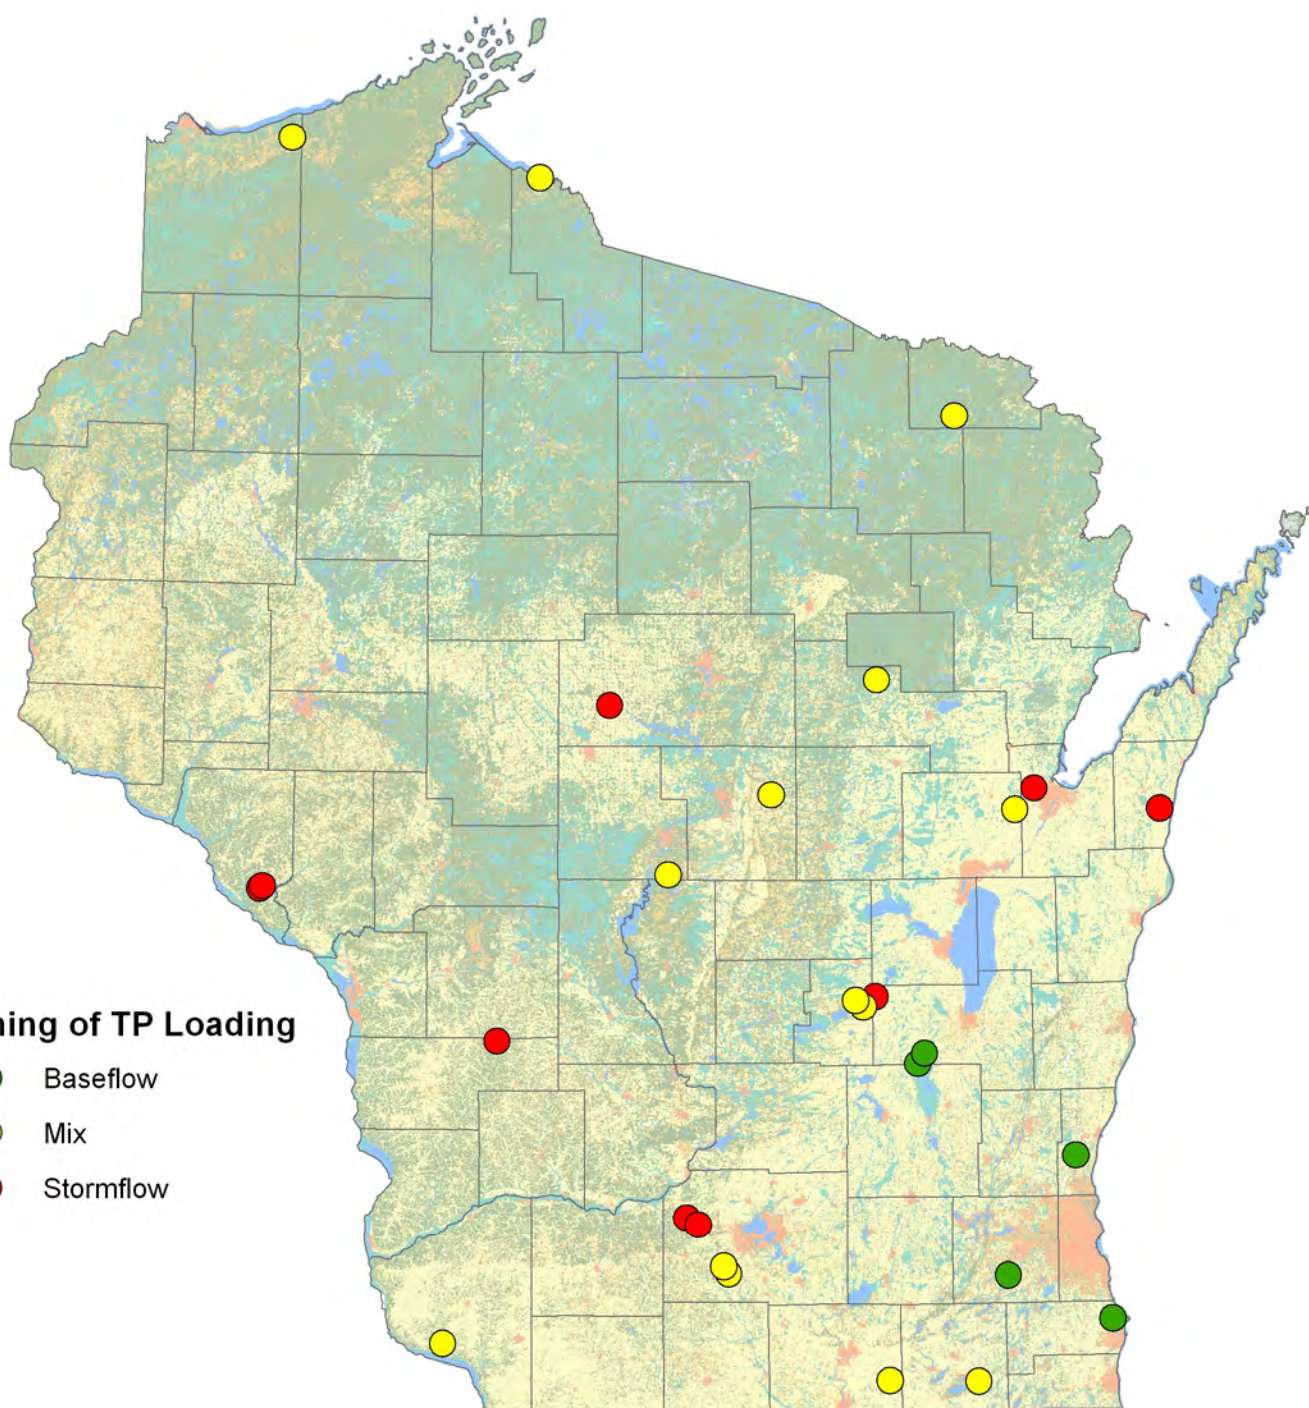

- 0 - 75
- 76 - 150
- > 151

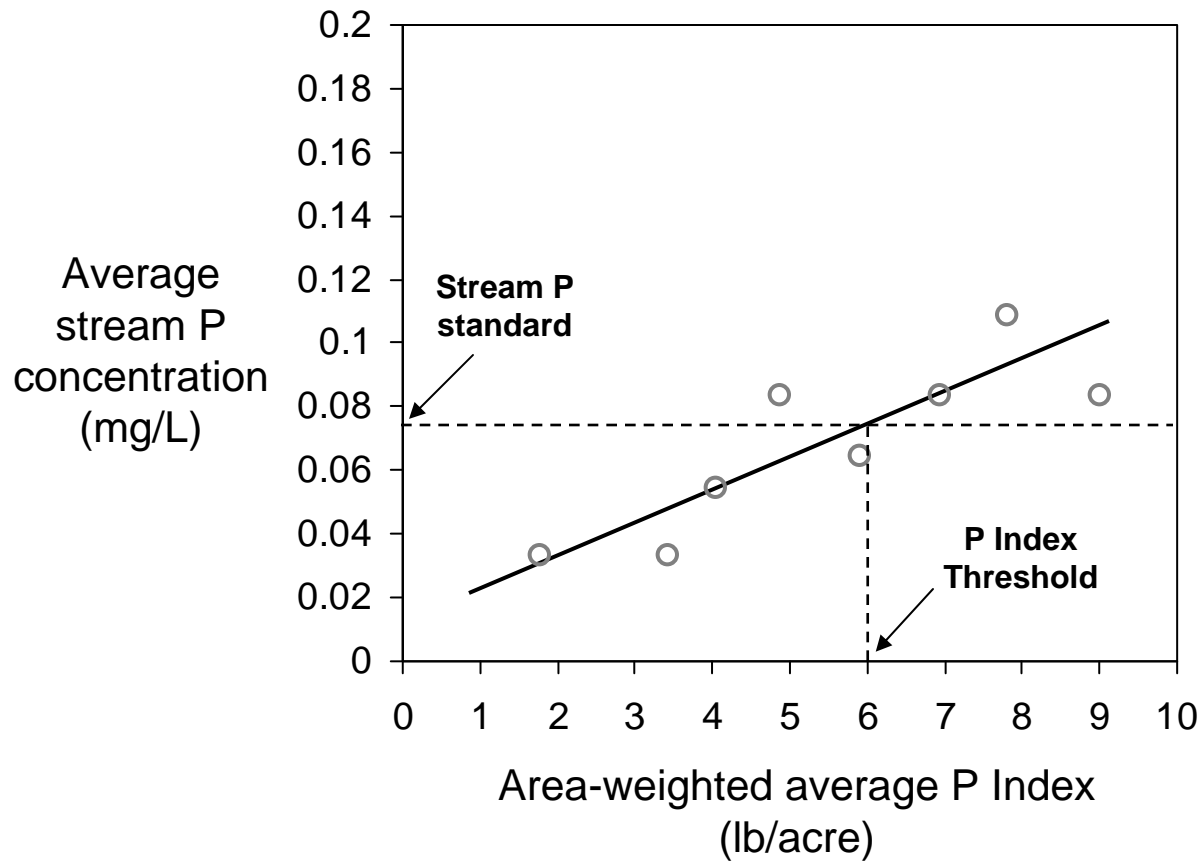

# Silver Spring Creek, Lafayette County

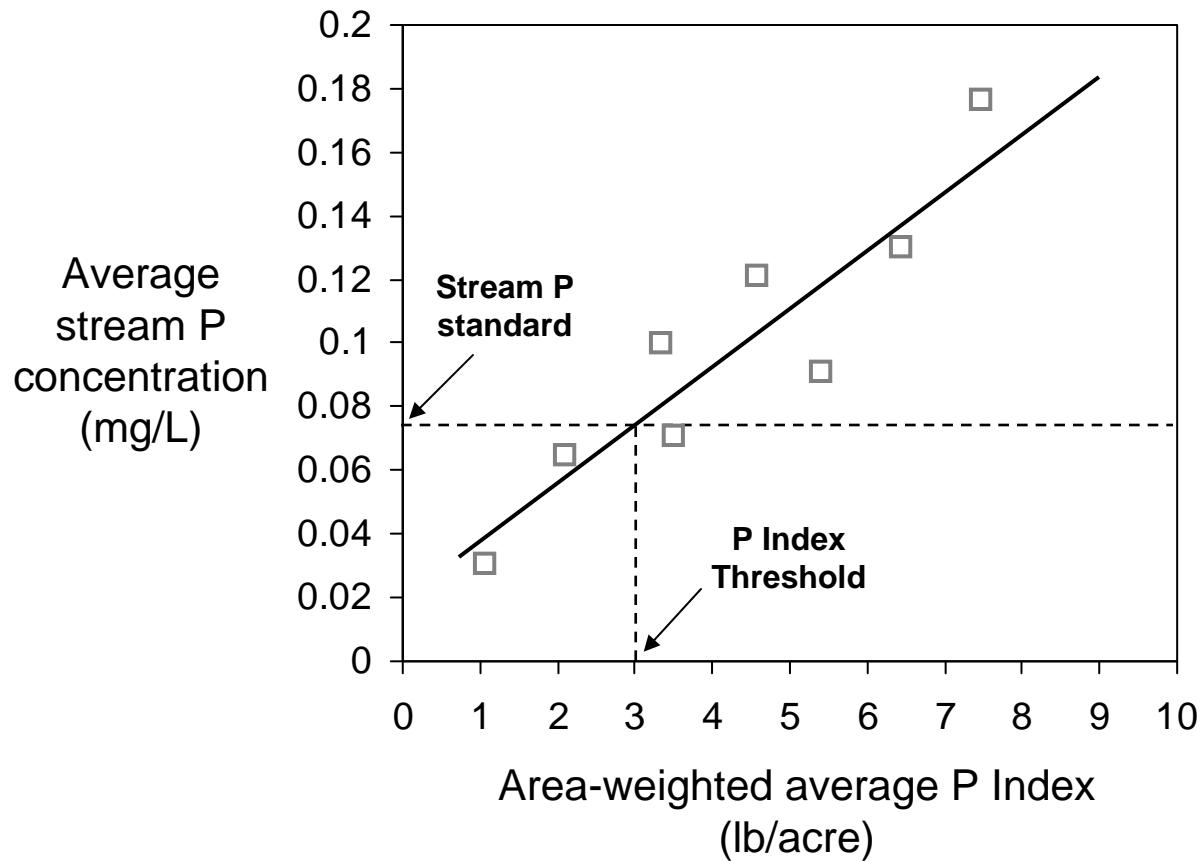

What P Index threshold will meet water quality standards?

What P Index threshold will meet water quality standards?

# Wisconsin Lake Modeling Suite (WiLMS)

<http://www.dnr.state.wi.us/lakes/model/>

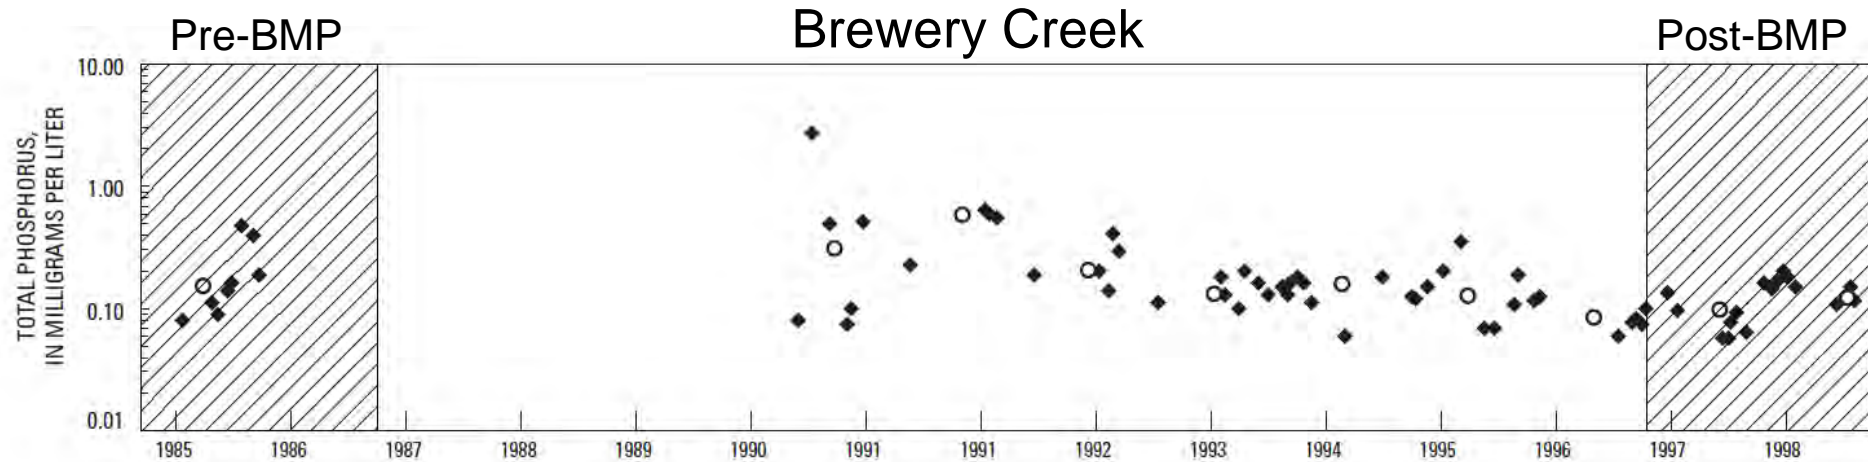

# Why does water quality improvement lag behind BMP implementation?

- Natural variability
- Soil P drawdown is slow
- Channel storage
- Baseflow vs. Stormflow

# Problem: Natural Variability

# Solution: Power Analysis

**Problem:** Soil P drawdown is slow.

**Solutions:**

- Promote practices that limit soil erosion.
- Use stormflow loads to evaluate BMP effectiveness.

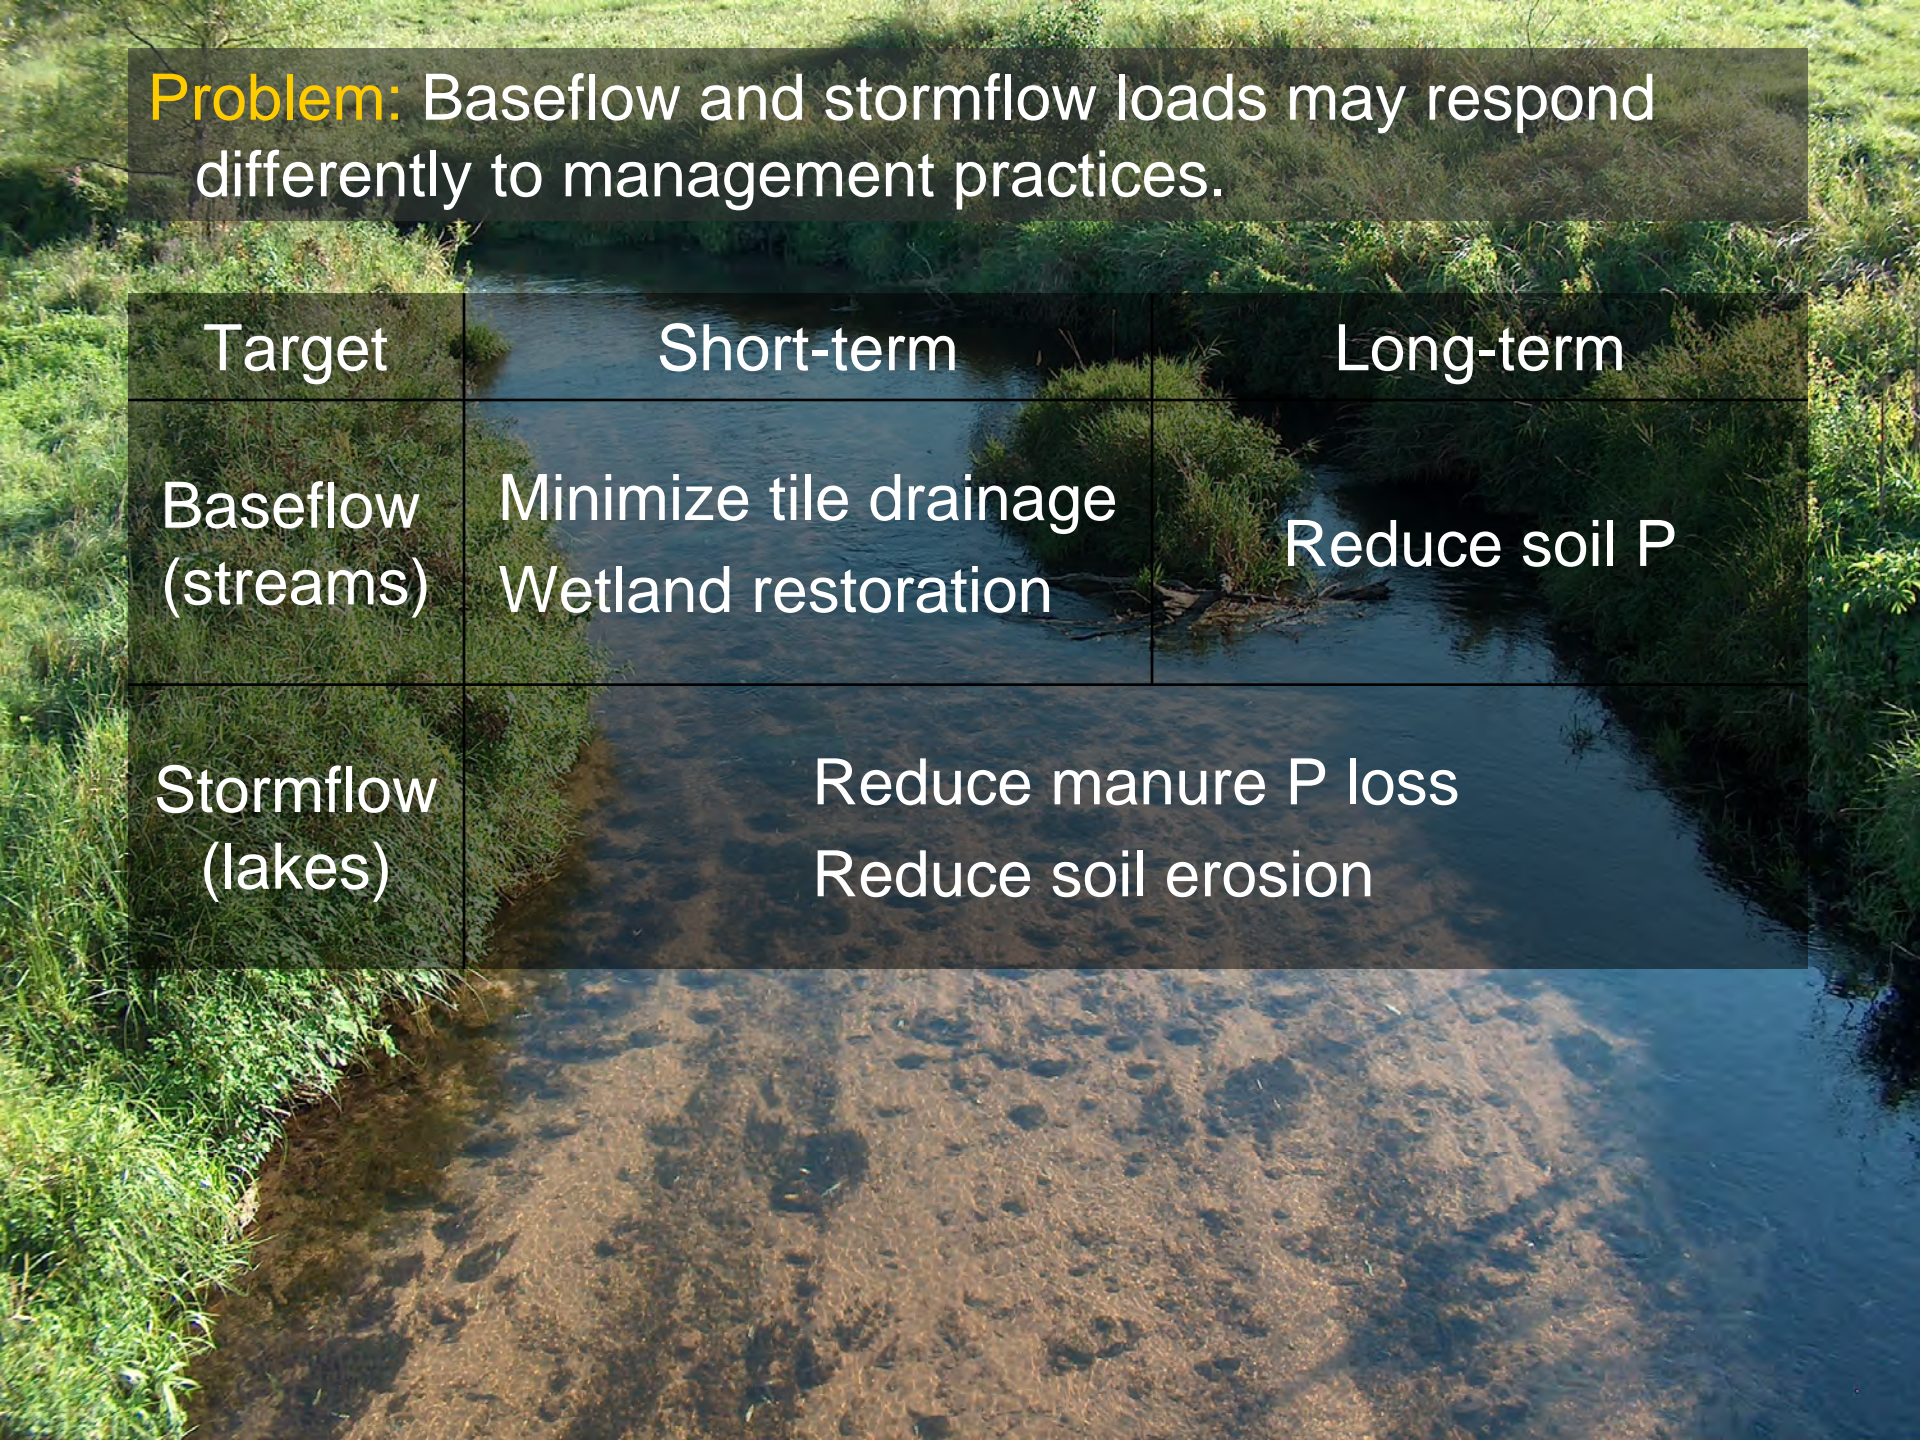

**Problem:** Channel storage of fine sediment may mask reductions from uplands.

**Solutions:**

- Include channel sources in sediment budget.
- Extend post-BMP monitoring.

A photograph of a stream flowing through a grassy field. The water is clear, revealing a rocky and sandy bed. The banks are covered in green grass and some small plants. A semi-transparent table is overlaid on the image, containing text about water management practices.

**Problem:** Baseflow and stormflow loads may respond differently to management practices.

| Target                | Short-term                                    | Long-term     |
|-----------------------|---|---------------|
| Baseflow<br>(streams) | Minimize tile drainage<br>Wetland restoration | Reduce soil P |
| Stormflow<br>(lakes)  | Reduce manure P loss<br>Reduce soil erosion   |               |

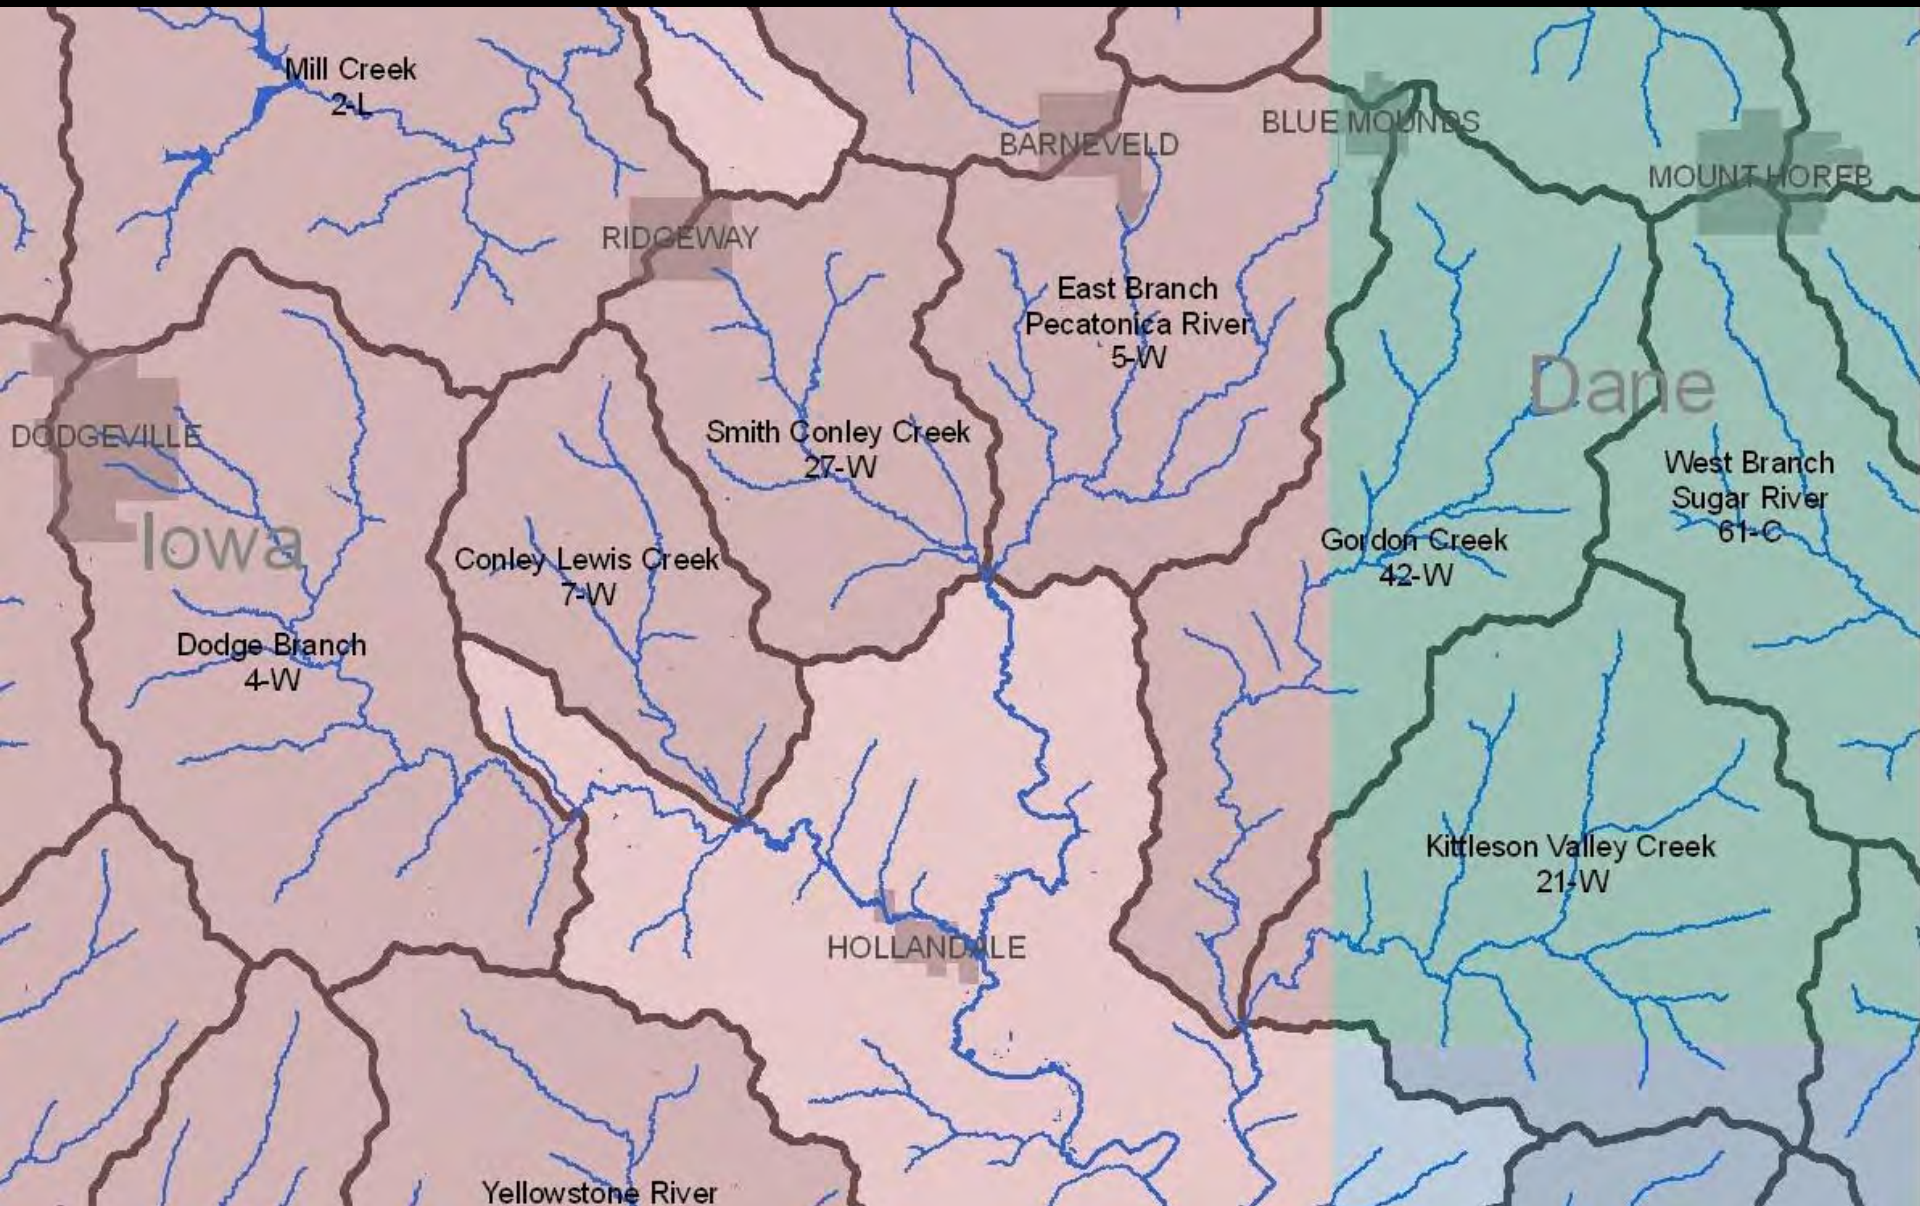

# How to prioritize watershed projects

- Watershed size
- Opportunity
- Minimize limiting factors
- Aim for ecological thresholds

# Watershed Size

# Opportunity

# Limiting Factors for Water Quality Improvement

# Aim for ecological thresholds.

# Summary

- Water quality standards can be used to set goals for watershed projects.
- Promote practices based on water quality goals.
- Account for lag times in monitoring design and practice selection.
- Select watershed projects that are most likely to achieve goals.
